Hydrogeomorphology has been defined as “an interdisciplinary science that focuses on the interaction and linkage of hydrologic processes with landforms or earth materials and the interaction of geomorphic processes with surface and subsurface water in temporal and spatial dimensions.”. The term 'hydro-geomorphology' designates the study of landforms caused by the action of water.

Terminology used in fluvial geomorphology, hydrology, sedimentology, soil science, climatology, and ecology is often inconsistent among the disciplines and within a discipline. The terms defined and described herein were compiled to: 1. recognize the overlapping needs of fluvial geomorphologists and hydrologists and the related perspectives of ...

Abstract The soil is where many of the hydrologic and biogeochemical processes that influence wetland function and ecology occur. A complete understanding of wetland formation, wetland ecology, and wetland management requires a basic understanding of soils, including soil properties, soil processes, and soil variability.

Geomorphology is the study of how planetary landscapes change through time in response to physical, chemical, and biological processes. Researchers in the department study landscapes over a wide range of scales, from particle-scale sediment transport to the global evolution of planetary surfaces, utilizing a variety of methods including computational modeling, field studies, and experimental work.

The Fundamentals of River Science: Applied Geomorphology and Ecology. August 3 - 7, Fergus Falls, Minnesota postponed to tentative date of June 14-18, 2021. This course discusses the fluvial geomorphological processes involved in creating and maintaining a stream's shape and stability, as well as the fundamental hydrology and hydraulics of rivers. We teach the skills necessary to properly determine a stream segment's type and degree of stability that requires the collection of field data ...

The aim of this Special Issue is to bring together recent research that advances understanding of the hydrology, geomorphology, and ecology of intermittent rivers and streams. We welcome contributions addressing any one of these topics and disciplines as well as interdisciplinary studies that link physical and biological components of intermittent stream systems.

Geomorphology is the study of landforms and landform evolution. The topic traditionally has been studied both qualitatively, which is the description of landforms, and quantitatively, which is process-based and describes forces acting on Earth's surface to produce landforms and landform change.
