During the last four decades, the analysis of radiocarbon and stable isotopes in terrestrial teeth and bones has provided valuable information about the palaeoclimatic and palaeoenvironmental conditions on the Quaternary period as well as palaeodiet habits for a variety of species.

The oxygen ( $\delta^{18}\text{O}$ ) and carbon ( $\delta^{13}\text{C}$ ) isotope compositions of bioapatite from skeletal remains of fossil mammals are well-established proxies for the reconstruction of palaeoenvironmental and palaeoclimatic conditions. Stable isotope studies of modern analogues are an important prerequisite for such reconstructions from fossil mammal remains.

Abstract. Stable isotopes in tree rings could provide palaeoclimate reconstructions with perfect annual resolution and statistically defined confidence limits. Recent advances make the approach viable for non-specialist laboratories. The relevant literature is, however, spread across several disciplines, with common problems approached in different ways.

My research focuses on development of stable isotope techniques for analysis of local- to regional-scale hydrologic processes and variability, and application of isotope hydrology, in combination with other methods, to investigate water-related issues such as the impact of oil sands extraction, acid deposition, forestry, mining, and past climate changes on aquatic ecosystems.

Introduction. This volume is intended to show how stable isotopes can be applied to understanding the palaeoenvironment. There are chapters on the interpretation of isotopes in water, tree rings, bones and teeth, lake sediments, speleothems and marine sediments. Crucial to the understanding of the environmental signal contained within the isotope composition of different materials is to gain more information about how rainfall isotope compositions are determined by climate.

These reviews rely on a variety of palaeoenvironmental proxies, such as pollen analyses, stable isotopes (e.g. from speleothems, lake sediments, land snails or wood) and geomorphological indicators. The next paragraphs summarize a series of major climate changes that seem to be recorded in most of the Levantine region during the Late Pleistocene and the Holocene.
